This course is designed for Hydrology, Environmental Engineering, and Geoscience students who seek to broaden their understanding of Geographic Information System (GIS) and Remote Sensing (RS) technologies. This course makes students familiar with the theory and application of GIS and RS technologies and trains students fluently using common GIS and RS software. The GIS part of this course focuses on vector and raster data models, their relationship with databases, creating high-quality maps, spatial complex analysis, geodatabase, programming with Python, geo-processing tools and advanced multi-criteria analysis. The RS part of this course presents the technical and methodological skills needed to interpret various types of aerial images as a source of information in a variety of applications, including geography, forestry, urban planning, crop and soil science, among many others. Exercises will utilize an extensive set of digital aerial images displaying a wide variety of environments (urban, rural, residential, agricultural) where students can practice the interpretation skills lectured in the course and apply them to decision-making across a variety of disciplines.

#### 16. 预达学习成果 Learning Outcomes

通过本课程的学习，学生系统掌握地理信息系统与遥感技术的理论框架，熟练使用 GIS 软件进行空间数据的构建、处理、分析与可视化，掌握常用的空间分析方法，理解电磁波谱与地物波谱特征理论，掌握遥感成像和影像增强原理，熟练应用遥感图像分类技术，具备综合应用 GIS 和 RS 进行水文与环境科学问题建模的能力。

After the course, students will be familiar with the basic theory of Geographic Information System (GIS) and Remote Sensing (RS). Students are able to using GIS software to create, process, analyze and visualize geospatial data, and to perform geospatial analysis with geo-processing tools. Students fully understand the fundamental theory of electromagnetic and earth object spectrum, and have the ability of performing imagery classification and object extraction with RS software. Finally, students are able to resolve modeling problems associated with hydrology and environmental problems by integrated using of GIS and RS techniques.
